

$$\log(xy) = \log(x) + \log(y)$$

- ① Log of the product is sum of the logs
- ② Log of the quotient is the difference of the logs
 $\log(x/y) = \log(x) - \log(y)$
- ③ Log of the power is that power times the log
 $\log(a^x) = x \log(a) = \log(a) \times$
- ④ Change-of-base formula says $\log_b x = \frac{\log_a x}{\log_a b}$

Simplify

$$\textcircled{5} e^{\ln(\sqrt{y})} = \boxed{\sqrt{y}}$$

$$\textcircled{6} {}_{10}\log(3x+1) = \boxed{3x+1}$$

$$\textcircled{7} \log(10^{y+1}) = \boxed{y+1}$$

$$\textcircled{8} \ln(e^{2k}) = \boxed{2k}$$

$$\textcircled{9} 7^{\log_7(999)} = \boxed{999}$$

$$\textcircled{10} \log_4(2^{300}) = \log_4(2^{2 \cdot 150}) = \log_4(2^2)^{150}$$

$$= \log_4(4^{150}) = \boxed{150}$$

121 54.3

Write as a single log.

$$\boxed{11} \quad \ln(x^8) - \ln(x^3) = \ln\left(\frac{x^8}{x^3}\right) = \boxed{\ln(x^5)}$$

Rewrite as sum/diff of logs

$$\log_3(xy) = \log_3(x) + \log_3(y)$$

Rewrite as sum/diff of multiples

of logs

$$\boxed{12} \quad \log(3\sqrt{x}) = \log(3x^{\frac{1}{2}}) = \log(3) + \log(x^{\frac{1}{2}}) \\ = \boxed{\log(3) + \frac{1}{2}\log(x)}$$

$$\boxed{13} \quad \log(3 \cdot 2^{x-1}) = \log(3) + \log(2^{x-1}) \\ = \boxed{\log(3) + (x-1)\log(2)}$$

$$\boxed{14} \quad \ln\left(\frac{\sqrt[3]{xy}}{t^{4/3}}\right) = \ln\left(\frac{(xy)^{\frac{1}{3}}}{t^{\frac{4}{3}}}\right) = \ln\left(\frac{x^{\frac{1}{3}}y^{\frac{1}{3}}}{t^{\frac{4}{3}}}\right)$$

$$= \ln(x^{1/3}) + \ln(y^{1/3}) - \ln(t^{4/3})$$

$$= \boxed{\frac{1}{3}\ln(x) + \frac{1}{3}\ln(y) - \frac{4}{3}\ln(t)}$$

15

$$\ln\left(\frac{6\sqrt{x-1}}{5x^3}\right) = \ln\left(\frac{6(x-1)^{\frac{1}{2}}}{5x^3}\right)$$

$$= \ln 6 + \ln(x-1)^{\frac{1}{2}} - \ln(5) - \ln(x^3)$$

$$= \ln(6) + \frac{1}{2}\ln(x-1) - \ln(5) - 3\ln(x)$$

Re-write as a single log.

16

$$\log_2(5) + 3\log_2(x)$$

$$= \log_2(5) + \log_2(x^3)$$

$$= \log_2(5x^3)$$

17

$$3\log_4(x^2) - 4\log_4(x^{-3}) + 2\log_4(x)$$

$$= \log_4((x^2)^3) - \log_4((x^{-3})^4) + \log_4(x^2)$$

$$= \log_4(x^6) - \log_4(x^{-12}) + \log_4(x^2)$$

$$= \log_4\left(\frac{x^6 x^2}{x^{-12}}\right) = \log_4(x^8 x^{12}) = \log_4(x^{20})$$

121 §4.8

- Find each log to 4 decimal places

$$\boxed{18} \quad \log_4(9) = \frac{\ln(9)}{\ln(4)} \approx 1.584962501 \approx \boxed{1.5850}$$

Recall we had a $\frac{\ln(3)}{\ln(2)}$ earlier \nearrow

Why the same #?

$$\frac{\ln(9)}{\ln(4)} = \frac{\ln(3^2)}{\ln(2^2)} = \frac{2\ln(3)}{2\ln(2)} = \frac{\ln(3)}{\ln(2)}$$

$$\boxed{19} \quad \log_{1/2}(12) = \frac{\ln(12)}{\ln(1/2)} \approx -3.584962501$$

$$\approx \boxed{-3.5850}$$

Solve round to 4 decimal places.

$$\boxed{20} \quad (1.0001)^{365t} = 3.5$$

$$\ln((1.0001)^{365t}) = \ln(3.5)$$

$$\ln(1.0001)(365)t = \ln(3.5)$$

$$t = \frac{\ln(3.5)}{365 \ln(1.0001)} \approx 34.32398919$$

$$\approx \boxed{34.3240}$$

121 $\sqrt[3]{4.3}$

21

$$(1+r)^3 = 2.3$$

$$\sqrt[3]{(1+r)^3} = \sqrt[3]{2.3}$$

$$1+r = \sqrt[3]{2.3}$$

$$r = \sqrt[3]{2.3} - 1$$

$$\approx 1.320006122$$

$$\approx \boxed{1.3200}$$

$$(1+r)^3 = 2.3$$

$$((1+r)^3)^{\frac{1}{3}} = 2.3^{\frac{1}{3}}$$

$$1+r = (2.3)^{\frac{1}{3}}$$

$$r = (2.3)^{\frac{1}{3}} - 1$$

22

$$1960 \rightarrow \$0.49$$

$$2009 \rightarrow \$4.59$$

Find annual growth rate.

Madison said compound annually.

I said compound continuously.

Book likes Madison more.

Let $t = \#$ of years after 1960.

$$\text{Then } P\left(1 + \frac{r}{m}\right)^{mt} = .49(1+r)^t$$

$m=1$
Madison

$$\text{Now } 2009 - 1960 = 49 = t \rightarrow$$

$$.49(1+r)^{49} = 4.59$$

$$(1+r)^{49} = \frac{4.59}{.49}$$

$$\sqrt[49]{(1+r)^{49}} = \sqrt[49]{\frac{4.59}{.49}}$$

$$\text{solve for } r$$

$$1+r = \sqrt[49]{\frac{4.59}{.49}}$$

$$r = \sqrt[49]{\frac{4.59}{.49}} - 1$$

$$\approx .0467161145$$

$$\approx .0467 \text{ or } \boxed{4.67\%}$$

121 S^{4.4}

23

Compounded continuously version

$$Pe^{rt} = .49e^{rt}$$

$$.49e^{49r} = 5.49$$

$$e^{49r} = \frac{5.49}{.49}$$

$$\ln(e^{49r}) = \ln\left(\frac{5.49}{.49}\right)$$

$$49r = \ln\left(\frac{5.49}{.49}\right)$$

$$r = \frac{\ln\left(\frac{5.49}{.49}\right)}{49} \approx .0493117988$$

$$\approx .0493$$

Note it takes
HIGHER rate compounded
continuously?!

OR
4.93%

Something must be wrong, Continuous
compounding grows faster with same r.
So why does it need a BIGGER r?

Can somebody help with this?

Should be 4.59, instead of 5.49.
That explains my question about
the final answer, here.
That will make the final answer
come out smaller, as it SHOULD
be.

See above. Scott
Corliss spotted the
mistake I made,
here.
