(1)

Use a mouse-click to get the cursor on the *?spacecurve* line, below, and hit enter.

?spacecurve

The online manual page will come up, and it'll explain use of the command. You could create a Maple document that just had all your "?"s in one document, as a quick-reference on the syntax of any command you used, before.

spacecurve([cos(*t*), sin(*t*), *t*], *t* = 0 .. 8·Pi, *numpoints* = 500, *thickness* = 2, *color* = black)

You can get by with just the "*t* = 0 .. 8*Pi" argument, and add the other 3, like I did. If you spend a lot of time in Maple Land, you'll pore over the "*?plotoptions*" pages, a lot, to tweak the displays.

A "handy" way to customize the display is to right-click and explore all the options that pop up. I think the option is "axes=normal" to do it inside the command, but I think you can just follow your pointer to the various options, starting with a right-click over the image.

Notice that I enclosed the list of 3 functions in square brackets?

```
spacecurve( [cos(t), sin(t), t], t = 0 .. 8·Pi, numpoints = 500, thickness = 2, color = black, axes  
= "boxed")
```

Ahh, *there* was a good guess on the argument to fit the pic inside a box, and display the box. "boxed" is one of the options for the axes in the pop-up menu, so it's pretty good about teaching you how to write the commands, if you're interested in that stuff.

```
spacecurve(⟨cos(t), sin(t), t⟩, t=0..8·Pi, numpoints=500, thickness=2, color=black)
```

If you look at that last command, above, you see that I changed the delimiters to `<>` from the square brackets `[]` that I used in the previous examples. It appears that MAT 203 notation can be followed.

Sorry for the following blather. You may SAFELY SKIP NEXT PARAGRAPH.

I learned with the square brackets, myself, because that was how the early, lisp-based CAS's were set up. Just no fuss with telling it how many places to reserve. As long as the multiplications made sense, it would perform them, flawlessly (Macysma on a Sun 3/60. State-of-the-art in its day, (mid-'80s) for the common man.)

NOW BACK TO THE EXPOSITION:

```
spacecurve( [t*cos(t), sin(t), t], t=0..8*Pi, numpoints = 500, thickness = 2, color = black, axes
            = "boxed")
```
